

Configuration Comparison Streamline Your Oracle ERP Cloud Management

Overview

Configuration Comparison is a powerful tool designed to simplify the management of Oracle ERP Cloud. By enabling robust configuration comparisons across environments, entities, and versions, it helps organisations maintain consistency, minimise errors, and enhance efficiency during implementations, upgrades, and audits.

Key Features

Multi-Environment Comparison – Identify discrepancies by comparing configurations across multiple environments (e.g., DEV, TEST, PROD) to ensure uniformity.

Entity-Level Comparison – Assess setups across different entities, such as Ledgers, Business Units, and Project Units, to maintain alignment where required.

Version Comparison – Analyse changes between application versions during upgrades or patching to better understand their impact.

Flexible Reporting

Tailor reports to meet your business needs with multiple output options:

- **Summary Reports** – Quickly highlight key differences between configurations.
- **Detailed Reports** – Provide comprehensive insights into each record with discrepancies.
- **Side-by-Side Comparisons** – View full setups in parallel, with differences clearly marked for easy analysis.

Advanced Synchronisation

When configurations diverge, Configuration Comparison generates transformation reports outlining the steps needed to realign environments. For migrations, it isolates differences, allowing for precise synchronisation by deploying only the necessary changes.

Use Cases

- **Implementations & Rollouts** – Ensure accurate and consistent configuration deployment across environments.
- **Upgrades & Patching** – Assess changes between versions to optimise testing and deployment strategies.
- **Audit & Compliance** – Maintain configuration consistency and provide verifiable evidence for audit requirements.
